AUTO TICKET CLASSIFICATION USING FLOW DESIGNER

PROJECT DESIGN PHASE

1. SYSTEM ARCHITECTURE

The project uses a ServiceNow-based architecture consisting of a custom ticket table, structured fields, dependent choices, Flow Designer automation and email notification.

High-level flow: Caller → Incident WorkFlow Record → Flow Designer Trigger → Keyword Evaluation → Category/Subcategory Update → Email Notification.

2. DATA DESIGN

A custom table named Incident WorkFlow is created to store ticket records. Auto Number is enabled for ticket identification.

3. FIELD DESIGN

The design includes reference fields for Caller, Assigned Group and Assigned to; choice fields for Category, Subcategory and State; and string fields for Short Description and Description.

4. DEPENDENT FIELD DESIGN

Subcategory is configured as a dependent field on Category. The documented relationships are:

- Wi-Fi → Network
- Projector → Hardware
- Forgot Password → Access
- Slow Computer → Performance

5. FLOW DESIGN

The flow is named Auto Classify School IT Tickets. The trigger is Record Created on the Incident Workflow table, with the condition Category is Empty.

6. DECISION LOGIC

Condition	Category	Subcategory
Short description contains Wi-Fi / Network	Network	Wi-Fi

Short description contains Projector	Hardware	Projector
Short description contains Forgot password	Access	Forgot Password
Short description contains Slow Computer	Performance	Slow Computer

7. NOTIFICATION DESIGN

After classification, the flow sends an email to Caller → Email. The documented subject is “Your Request for the issue has been submitted.”

8. DESIGN OUTCOME

The design defines the table, fields, dependencies, trigger, classification branches, update actions and notification needed for implementation.

Source basis: uploaded PDF “Auto Ticket Classification using Flow Designer”. No outside technical content has been added to the phase-specific descriptions.
